ARTICLE HISTORY

Compiled February 17, 2019

The total energy as a function of the magnetic field strength for all states obtained in the calculations with the finite-element (FEM) calculations with HELFEM, and the gauge-including Gaussian-type orbital (GTO) calculations with LONDON are shown in Figs. 1 to 2 for H₂, in Figs. 3 to 4 for HeH⁺, in Figs. 5 to 7 for LiH, in Figs. 8 to 10 for BeH⁺, in Figs. 11 to 13 for BH, and in Figs. 14 to 16 for CH⁺. The resulting ground-state configurations in the FEM and GTO calculations have been identified in table 1 for H₂, HeH⁺, and LiH, and in tables 2, 3 and 4 for BeH⁺, BH and CH⁺, respectively.

Table 1.: Ground-state configurations for H_2 , HeH^+ , LiH, and BeH^+ as a function of the magnetic field strength calculated at the Hartree–Fock level using gauge-including Gaussian-type orbitals (GTO) and finite element (FEM) basis sets. The label X refers to symmetry-broken orbitals. Note that the orbitals are not sorted according to their energies.
